Technical Overview Autodesk products are based on the same software engine, which is the Win32 platform, an object-oriented, Microsoft Windows API. The concepts used in Autodesk products were developed in order to fit with the needs of a spreadsheet and database design application (Autodesk Project Gallery). With the rise of .NET, the engine has been re-written to use a number of new features available in the Microsoft.NET Framework and libraries. The Win32 platform is designed to provide access to low-level Win32 functions and is an object-oriented programming (OOP) environment that offers a rich set of functionality. The basic nature of the Windows operating system provides a consistent and reliable environment for the programs that run on it. This allows Autodesk products to run on virtually any Windows operating system and hardware platform. Win32 is a cross-platform API, which is a set of "object-oriented" functions that work like the built-in programming commands in C++. From Win32, it is possible to create new objects (objects of classes) and manipulate these objects. A number of extensions are available for Win32 which allow more programming functionality and efficiency. These extensions include: Threads COM Automation Internet Advanced Direct Manipulation The Win32 program uses the following key concepts to access the system: Autodesk applications can make use of a software developer kit (SDK) to create software plugins, which can be either standalone or embedded within Autodesk products. The SDK is developed in the Java programming language, and the Java virtual machine provides an environment in which to create applications. The Win32 platform has a number of standard and standardised programming interfaces (SPIs). These include the following: Advanced Direct Manipulation (ADM) The ADM API allows developers to make use of advanced functions to create applications in a Windows environment. ADM is a set of programming interfaces that allow the creation of toolbars and user interfaces. ADM is also used to access the drawing from inside AutoCAD. IPP - Internet Printing Protocol The IPP API provides software developers with programming interfaces to enable software to access the Windows Internet Printing Protocol. This API is used to allow Autodesk applications to interact with Windows-based printing devices, such as network printers. COM Microsoft Component Object Model (COM) is a development model based on distributed objects. COM classes are created by programmers a1d647c40b
