This article is for beginners who want to make their own home bar DIY project. And this project is inexpensive with low cost! This project will be using two different steps, including the tutorial and the instructions. The whole process will take around two weeks, not as long as previously thought (it will be much faster). STEP 1: Gather the materials and get prepared The project is made from bamboo plywood. The wood sheet should be at least 20 cm thick, and its dimension should be in one meter (unit of length) from each edge. And the wood sheet will be cut into strips, about 20 cm wide and 3-4 m long. I use a miter saw to cut the bamboo wood sheet into strips. You can cut bamboo wood by hand with a sharp knife. I cut the strips of bamboo as shown in the figure below. You can easily cut the bamboo plywood with a miter saw. But I use the hand saw. I use a table saw to cut the wood strips (poles). I bought a 12-inch miter saw blade from my local store to cut the wood strips. I will use it for two years at least. I also bought a rope cutter, to cut the bamboo wood into strips. Before cutting the bamboo wood, make sure that the bamboo has no wood defects like knots, cracks, and saw marks. Cut out two circles in the middle of the bamboo wood as shown in the figure below. You can also cut the bamboo wood with a sharp knife. The width of the circle is 20 cm and its diameter is 10 cm. Use a glue to fix the bamboo wood. Use strong glue. After that, spread the glue on both the top and bottom of the bamboo wood. The bamboo wood will get sticky when the glue is dry. Step 2: Build the entire apparatus After the glue is dry, cut out three circles in the middle of the bamboo wood. I used a ruler to mark the circles, and then I cut out the circles using a miter saw. Cut a groove in the bamboo wood. Use a ruler to

Use a Templates to Create New Documents Autocad offers templates that you can use to create new projects. Each of these templates has a title and a series of pages. The pages, or drawings, that you create or modify are assigned a title as well. The advantage of templates is that they can be stored as files and then reused by creating a new drawing based on the template. To create a new template, follow these steps:

Markup Assist If you've used a traditional CAD program, you're used to entering your components' outlines and dimensions using the keyboard. But it can be challenging to enter the outline or dimension of a complex component with the keyboard alone. Markup Assist lets you use a graphic layout to place an entire design in place. And you can mark up any shape or edit any measurement from within the drawing. (video: 1:40 min.) Variation Color Previews: View all variation colors at once. Previews can display differences between color schemes or material settings for multiple variants. You can see colors, pattern repeats, and gradients used for all variants of a component, without having to look up the color codes. (video: 3:30 min.) Draw Flow Chart: Easily generate flow charts of your drawings by using the command Draw Flow Chart. The features of the command are similar to those of the command to draw a graph, but you can add text, arrows, and shaded areas to help you communicate your ideas to others. (video: 2:06 min.) Mark and Analyze: Use simple text tools to mark areas of an image, and then easily view them in a map. Start the analysis by creating a point, and then quickly mark your position in a large image area by using a shape. Then zoom in to see the details. You can easily view a 3D map of your marked-up image. (video: 1:10 min.) Infinite Drawing Scales: Eliminate errors when using high-precision drawings, with auto-sizing. Drawings can have any scale, so you don't have to determine drawing size and placement in a separate operation. While you're drawing, the command estimates the size and places the drawing as if it had a fixed scale. (video: 1:32 min.) Style Manager: As your style library grows, the number of shared styles you use increases. You may find that you cannot find the right style or the perfect color combination. The Style Manager helps you create, manage, and use your styles. New commands can access your library and create an unlimited number of styles. The Style Manager includes a new library and a new style gallery to make your work even easier. (video: 1:38 min.) Start-to-Finish Def
