

Wireless receiver will no longer show up on dmesg message when the daemon is running. Instead it will just power up. My new code ran the DACS without crashing and had no issues with the graphics or sound. Great work! In terms of the dtoid compatability list, it looks like compatibility mostly depends on the music. Moreso than firmware or drivers. I have been reading about unofficially compiled firmware, and that might be a good option to have. I might try that just for fun and see how it works. -electrical Great work, BTM will be fun for years to come. -Aditya Quote: Originally Posted by Rob Sullivan I downloaded and updated the firmware to version 4.6.0 and rebooted and the game runs fine. Thank you for the heads up Rob, I am glad you could get it to run. Quote: Originally Posted by Rob Sullivan Does someone have a current version of the firmware that they could send to me? I will try to get this to him today. Thank you. Quote: Originally Posted by Rob Sullivan The server will update the firmware automatically. I will upload a new version later today. Thanks for your patience. -electrical I sent the file an hour ago and just got the reply now. Thank you very much. Please try the official download link in the. These are not included: Direct Download;Â Bloons TD5Â .Q: SAS Debug Output I know what SASDEBUG is, and I thought I understood it: PROC SQL; SQL%WHERE ('SASDEBUG = 1'); is what I am looking for. I was hoping to see the script that would run on the server. But now, I have a situation where the output is not what I want: PROC MULTILINEMACRO; MULTILINEMACRO = 1; PROC SQL; SQL%WHERE ('MULTILINEMACRO = 1'); is what I get. But this is not what I want. More context: I am writing a procedure that will be used to run multiple systems, thus I want to make sure all systems are built in the same way. I am using the database to do this. Therefore, I do not want some instances to be tied to the database. I want to make sure that all instances are set up in the same way. So, I know I need to do something similar to the first two procedures. A: I'm afraid there is no easy answer, as you would be trying to run a virtual machine. If you want a single specific instance of the code to be different, it's usually best to leave a code block in the middle as the minimum amount of logic that will be checked for differences and the next chunk of code as the incrementally different code. Like this: PROC SQL; SQL%WHERE ('DBNAME = &SYSDAB.' & SYSDEV.); PROC SQL; SQL%WHERE 3e33713323
