SQL Server 2008 has made a great improvement in the way text is stored in the server. It uses stored procedures, views and several other mechanisms to provide Text and Unicode support. The stored procedures that create extended and user defined data types are documented and part of the public documentation available. The one that we will focus on here, while is not publicly available, is collation. A collation defines the sorting order of the text and the characters that are used in the sorting. The default value of the collation for text and Unicode is a case sensitive order. If you have any specific requirements you can change the collation to a case insensitive order. This can be achieved by modifying the collation in the database and setting the 'SQL_NO_CASE_SENSITIVE_COLLATION' configuration option. This has an impact on the database system too, and may require changes to the collation of other objects. SQL Server Compatible Collation: Currently a SQL Server collation can be set either as Unicode or as ANSI. This is consistent with the definition of Unicode and ANSI in SQL Server as defined in the Unicode chapter. This is also fully compatible with the Unicode definition of UTF-8. SQL Server Unicode Collation: This option to define a collation as Unicode can take either the Unicode form or the ANSI form of the same name. This is consistent with the definition of the Unicode form in the Unicode chapter. It can be seen that the Unicode form of the collation is common to both Unicode and ANSI, but the ANSI form has a form that is further restricted to ISO-8859-1. To define a SQL Server Unicode collation you need to specify the 'ANSI_CHARSET_NAME'. When working with SQL Server 2008 databases, collations are created on the database level in the "Database Properties" dialog and are usually not applied at the column level. This means that the collation can be defined on the database and table level, but it will not be applied unless you run a SQL statement on a column or a table. Examples of the SQL_NO_CASE_SENSITIVE_COLLATION configuration option are: CREATE TABLE... SQL_NO_CASE_S

CPU Usage Analyzer Rating: Reviewed By: Joshua Reaves Follow @joshuraves This program is an information-packed utility that displays information concerning the network connections of your PC. It allows you to easily view, manage and control the traffic going in and out of your machine, as well as the locations of your internet-enabled devices. The application displays network utilization information in a series of windows. These windows are displayed in a sidebar arrangement in the left-hand side of the main display, and divided into seven main sections. The application will display the detailed information related to the connections pertaining to your machine and any of the available internet-enabled devices on your network. The sections of the sidebar are the following: Wireless Static IP DNS Proxy Internet Explorer Windows Applications In addition to the seven sidebar windows, the main information is displayed using a simple graph representation of the individual network connections. When you launch the application, you will be greeted by a welcome splash screen, followed by the seven sidebar windows. The left-hand side of the application displays a heading labeled "Network Connections". Clicking on this will display the complete network connection information for your machine. Below is a screenshot of a typical network connection – the left-hand side of the application window displays this information. By default, the

application is set to display network connections on the following devices: • Local network connections • ADSL connections • Default gateway • Windows Firewall • Windows Connection Management By default, the application also removes the connection details for the following devices: • VPN connections • Bluetooth device connections • Bluetooth car links • Dummy devices Unfortunately, there is no way to control the settings within the application, or to view detailed information about each connection device, such as the device's IP address. The configuration settings for the device list are located within the "Settings" directory of the application's installation folder. In most cases, the settings are currently configured to display all available connections to the internet. The only setting is the default setting for "When a connection is established", which enables or disables the display of the network connection window at the startup of the application. QuickSlice is a simple program that displays information about the usage of CPU by different system processes in real-time. The information is presented in a graphical form, allowing you to identify processes that use a lot of CPU. QuickSlice Features:

- Shows process CPU usage in a graphical form
- Updates the information continuously
- Displays a full list of processes
- Real-time
- Displays most frequent CPU processes and their percentages
- Minimal configuration
- Displays processes running on remote computers
- Supports x64 CPU architectures

Note: This application is not the same as the Task Manager utility. You can open the Task Manager to display the process CPU usage for system processes. This is a utility that allows you to convert MP3 and WMA files to Ogg Vorbis. The Ogg Vorbis file format is open source (www.vorbis.com) and is designed to improve upon the shortcomings of the MP3 format. The Bink codec is used to compress the encoded files, and the Flac codec is used to decompress them. Flac is free and open source (The Bink codec is proprietary and can only be used with a special edition Sony Bink player. Bink is closed source and owned by Sony. The program checks to make sure that the encoder and the decoder are in a state of readiness. When the encoding of a file is ready, this information is displayed, including a play button. When the encoding of a file is finished, the results are shown in the same window. After verifying the results, the program ends cleanly. An Internet Explorer browser helper object, the IeDebugHider, is a security component that runs automatically within all versions of Internet Explorer for the purposes of monitoring and intercepting HTTP transactions. This security vulnerability allows remote attackers to execute arbitrary code on the target computer by tricking users into opening a booby-trapped Web page. The vulnerability exists because Internet Explorer fails to properly parse the data of certain objects in certain Web pages. This results in malicious objects being incorrectly injected into the Internet Explorer memory space, resulting in an arbitrary code execution vulnerability. SOS-MP3.vbs is a file recovery utility that uses the Data Recovery Wizard's Recover Deleted Data feature. This is a security risk to your computer, and it is recommended to run a full recovery to remove all traces of

Keep an eye on the CPU load of running applications, or create and store CPU usage charts, directly in your Windows taskbar. QuickSlice allows you to monitor your CPU usage and get process information on a graphical level. With such a graphic user interface, it is easier to use and understand, than the standard Windows Task Manager. QuickSlice displays information in a similar manner, like the freeware Pstat.exe utility, but contains some extra features. It displays not only the active processes, but also lists all processes that are not currently running. Apart from the number of the process in percentage, information such as name, CPU usage and PID, can also be displayed. Each process displays on a separate graph, and the CPU usage can be set using the scrollbar. The graphs can be zoomed in and out, and the CPU usage can be scaled and reset to 0%. The CPU usage display can be changed to show the maximum, average and minimum usage percentage. There are 3 different display modes available:

1. Fixed – the user can adjust the CPU display settings with sliders at the bottom of the window, the display will remain at their current settings.
2. Graph – the user can manually control the CPU percentage of each process, the display will not change until the user changes the settings.
3. All – the user can change the CPU display settings with the sliders, and only the current display settings will remain.

QuickSlice supports 32 and 64-bit Windows systems, as well as all 32-bit versions of Windows 95, 98, Me, NT, 2000, XP, 2003 and 2008. The

program also works with Windows Server 2003 and 2008. Key Features: 1. CPU usage display of any active processes, and all stopped processes. 2. Process monitoring at the system level. 3. User adjustable CPU display modes. 4. Fully customizable CPU and memory usage graphs. 5. Fast real-time calculation and update of CPU and memory statistics. 6. Sends notified in real-time when an application is upgraded or fails. 7. User customizable CPU display settings. 8. System tray icon. 9. DNS monitoring. 10. Import and export of statistics to both TXT and CSV formats. 11. Start-up screen provided for easy setup, and on-the-fly configuration. Slideshow Viewer is a free slideshow maker program that lets you create and edit a large variety
