WAVE XTRACTOR.full.rar WAVE XTRACTOR.full.rar the finiteness of the global minimum is obvious. Although we do not know how to prove this rigorously, we can check that there are only a finite number of choices for n and t in a specific region of the (r,γ) -plane. This is trivial if r is too small or too large. Therefore we consider only the region where r is between 10^{-4} and 2 and γ is positive and less than or equal to $\frac{1}{\sqrt{r}}$. For $r=0$ and $\gamma=\frac{1}{\sqrt{10}}$, the global minimum is 1. For γ^2 , the global minimum is about 0.27. The picture above is qualitatively correct and the upper bound obtained from the linear analysis should be very close to reality. When $p=1$, the above analysis shows that the second derivative of f is negative, which means the function is concave. This is consistent with the result of Petri, that the given lattice is almost periodic of order 2. Appendix: Proof of Theorem [main result] ===== In this appendix, we prove Theorem [main result]. We need some lemmas. [hierarchy] For $m\in\mathbb{N}$, $s\geq 1$, $T>0$ and $\mu_0,\mu_1\in\mathbb{Z}$, there are constants C_0,C_1 and $n_0\in\mathbb{N}$ such that $n\geq n_0\implies\left|\mathrm{ver}\hat{\mu}_0n^\alpha\hat{\mu}_1n^\beta\right|$
